

Here is a different way to put the same point. We have, it seems, a conflict
between the following two claims:

If you cannot rule out a situation which would make P false, you should not believe P .

I should believe that
I have hands.

One can think of Moore as asking the proponent of our skeptical argument:
which of these do you feel more sure of? Which, if you had to, would you bet
your life on?

Moore thinks that we are, and should be, more sure of the second of these.

But then why shouldn't we take his proof of an external world to demonstrate the unsoundness of the argument for skepticism about the external world, rather than the other way around?

Indeed, we can construct a simple argument against the Doubt $\rightarrow$ No Belief rule which was central in the argument for skepticism.
