

So we have to choose.

If you cannot rule out a situation which would make P false, you should not believe P .

I should believe that
I have hands.

And, as mentioned above, it is plausible that the choice comes down to these two premises:

Suppose that we agree with Moore that we are,
and should be, more confident in the second of
these. What follows?

It seems to follow that we should have some basic beliefs even when we cannot rule out some situations in which those beliefs would be false.

But this raises the question: when is this ok?
What are the conditions under which I should
believe something without having a good
argument for it?

The example of the belief that I have hands suggests at least a partial answer to this question. Why do I believe that I have hands? Presumably because I can see them.

That suggests the following rule of belief:

For our purposes, we might count memories as a kind of experience. So, if I seem to remember something, and have no reason to doubt my memory, I should believe that that thing happened.

Let's put this together with our positive rule of belief.

Experience → Belief

If your sense experience tells you that P, and you have no reason to think that your sense experience is misleading, you should believe P.

If you can't rule out a
