

Enough about probability (for now). Let's turn now to some results from contemporary physics which will be important to the argument which follows.

A first question: what does the theory provide by physics include?

“The standard model of physics presents a theory of the electromagnetic, weak, and strong forces, and a classification of all known elementary particles. The standard model specifies numerous physical laws, but that's not all it does. According to the standard model there are roughly two dozen dimensionless constants that characterize fundamental physical quantities.” (Hawthorne & Isaacs, “Fine-tuning fine-tuning”)

These 'dimensions' will be our focus.

One such constant is the cosmological constant, which measures the energy density of empty space.

The cosmological constant is just a number which (as far as we know) could have different values consistent with the laws of physics.

One thing that the standard model of physics gives us is a measure of how likely it is, given the laws of the nature, that the fundamental constants (like the cosmological constant) would fall in a certain range.

We can make certain plausible assumptions about what it would take for life to have evolved. For example, if there were nothing but hydrogen, it is hard to see how life could have evolved. If there were no planets, it is hard to see how life could have evolved.

Given assumptions such as these, we can look at what the standard model of physics tells us about how likely it is that, for example, the cosmological constant has a value which would permit the evolution of life.

“Physicists have determined the (approximate) values of the fundamental constants by measurement.

(There's no way to derive the values of the fundamental constants from other aspects of the standard model. Any quantities that could be so derived wouldn't be fundamental.) Still, the underlying theory favored some sorts of parameter-values over others. ... Physicists made the startling discovery that -- given antecedently plausibly assumptions about the nature of the physical world -- the probability that a universe with general laws like ours would be habitable was staggeringly low.”

This is the claim that that the cosmological constant having a life-supporting value, given the laws of nature, is very low.

We should emphasize just how small we take the life-permitting parameter values to be according to the physically-respectable measures. “Small” here doesn’t mean “1 in 10,000” or “1 in 1,000,000”. It means the kind of fraction that one would resort to exponents to describe, as in “1 in 10 to the 120”. The kind of package that we have in mind tells us that only a fantastically small range is life permitting.

The claim is that, according to current physics, the probability of the cosmological constant falling in a life-supporting range, given the laws of nature, is $\frac{1}{10^{120}}$.

This is the claim that that the cosmological constant having a life-supporting value, given the laws of nature, is very low.

It means the kind of fraction that one would resort to exponents to describe, as in “1 in 10 to the 120”. The kind of package that we have in mind tells us that only a fantastically small range is life permitting.

Let's now ask how to turn these facts about current physics and probability theory into an argument for the existence of God.

Much as we considered two different hypotheses about the number of balls in the urn, so we can consider two different hypotheses about the origins of the universe.

It seems at least reasonably plausible that, if the universe were created by an intelligent designer, that designer would make it the case that the fundamental constants are such as to permit life. Just to pick a number, let's suppose that

What we want to know is: what are the probabilities of our two hypotheses, conditional on our evidence?

$$Pr(\text{life} \mid \text{design}) = 0.5$$

Bayes' theorem

$$P(h|e) = \frac{P(h)*P(e|h)}{P(e)}$$

objections

Let the **design hypothesis** be the combination of the hypothesis that the universe was created by an intelligent designer with the hypothesis that the laws of nature are much as contemporary physics says that they are.

Let our life be the claim that life exists.

Let the **non-design** hypotheses be the combination of the hypothesis that the universe was **not** created by an intelligent designer with the hypothesis that the laws of nature are much as contemporary physics says that they are.

$$Pr(\text{life} \mid \text{non-design}) = \frac{1}{10^{120}}$$

Our discussion above suggests that this probability should be tiny. The reason is that, according to current physics, the probability of the physical constants being in a life-permitting range is tiny and, if the constants are not in a life-permitting range, there is no life. So that suggests:

hypothesis that it was not.

Let the design hypothesis be the hypothesis that the universe

created by an intelligent designer. Let the non-design hypothesis be the

Let e be the fact that the cosmological constant has a

value in the life-permitting range.

Then what do we know about relevant probabilities?

$$Pr(e \mid \text{non-design}) = \frac{1}{10^{120}}$$

$$Pr(e|\text{design}) \equiv 0.5$$

With this information in hand, figuring out the probability of the non-

design hypothesis given evidence is that just plugging in the

numbers.

$$Pr(\text{non-design}) = 0.5$$

$$Pr(\text{design}) = 0.5$$

$$Pr(e) = 0.25$$

$$Pr(\text{non-design} \mid e) = \frac{0.5 * \frac{1}{10^{120}}}{0.25} = \frac{2}{10^{120}}$$

to give you some idea: the odds of winning Powerball are about 1 in 300 million. Now

It is difficult to think about numbers as large as the denominator of this fraction. But

PowerBar!

consider the odds of winning Powerball one trillion times in a row. Call that a “super

Now consider the odds of winning a super Powerball one trillion times in a row. Call

that a 'super duper Powerball.'

The odds of this happening are about $1/10^{44}$ — so much, much higher than the

odd of the universe being life-permitting by chance.

Now consider the odds of winning a super Powerball one trillion times in a row.

This means that if you simply take the physics at face value, and begin by assigning a

probability of 0.5 to the non-design hypothesis, you should think that the chances of

the non-design hypothesis being true are vastly lower than the chances of winning a

superduperpowerball a trillion times in a row.

By contrast, the probability of the design hypothesis is very close to 1. It is, in fact, 1.

minus the very small number we're just discussing:

$$Pr(\text{design} \mid e) = 1 - \frac{2}{10^{120}}$$

This is about as close to certainty as it is possible to get.

$$7. P(\text{design}) \approx 1. \quad (5, 6)$$

8. If the universe was created by an
