

One diagnosis is that we need to distinguish between two pieces of evidence we

might have:

The existence of many rollers would make Evidence 2 more likely. Would it make Evidence 1 more likely?

If not, then it looks like Evidence 2, but not Evidence 1, provides evidence for the many rollers hypothesis. Since in our imagined scenario what I possess is Evidence 1, my inference that there must be many rollers was illegitimate.

A Bayesian argument for many dice rollers

I am sitting in my office, and I pick up 12 dice and decide to roll them. I roll all sixes. Amazed, I think to myself: there must be lots of people rolling dice in Malloy Hall right now. After all, what are the odds that someone rolls 12 sixes in Malloy in the case where there is just one person rolling dice?

E1. I rolled
12 6's.

E2. Someone
in Malloy
rolled 12 6's.

follows.

Enough about probability (for now). Let's turn now to some results from

contemporary physics which will be important to the argument which

A first question: what does the theory provide by physics include?

“The standard model of physics presents a theory of the electromagnetic, weak, and strong forces, and a classification of all known elementary particles. The standard model specifies numerous physical laws, but that's not all it does. According to the standard model there are roughly two dozen dimensionless constants that characterize fundamental physical quantities.” (Hawthorne & Isaacs, “Fine-tuning fine-tuning”)

These dimensions

One such constant is the cosmological constant, which measures the

energy density of empty space.

The cosmological constant is just a number which (as far as we know)

could have different values consistent with the laws of physics.

One thing that the standard model of physics gives us is a measure of how

likely it is, given the laws of the nature, that the fundamental constants

(like the cosmological constant) would fall in a certain range.

We can make certain plausible assumptions about what it would take for

life to have evolved. For example, if there were nothing but hydrogen, it is

hard to see how life could have evolved. If there were no planets, it is hard

to see how life could have evolved.

of physics tells us about how likely it is that, for example, the cosmological

constant has a value which would permit the evolution of life.

Given assumptions such as these, we can look at what the standard model

“Physicists have determined the (approximate) values of the fundamental constants by measurement.

(There's no way to derive the values of the fundamental constants from other aspects of the standard model. Any quantities that could be so derived wouldn't be fundamental.) Still, the underlying theory favored some sorts of parameter-values over others. ... Physicists made the startling discovery that -- given antecedently plausibly assumptions about the nature of the physical world -- the probability that a universe with general laws like ours would be habitable was staggeringly low.”

This is the claim that the cosmological constant having a life-

supporting value, given the laws of nature, is very low.

We should emphasize just how small we take the life-permitting parameter values to be according to the physically-respectable measures. “Small” here doesn’t mean “1 in 10,000” or “1 in 1,000,000”. It means the kind of fraction that one would resort to exponents to describe, as in “1 in 10 to the 120”. The kind of package that we have in mind tells us that only a fantastically small range is life permitting.

nature, is

The claim is that, according to current physics, the probability of the

cosmological constant falling in a life-supporting range, giving the laws of

Let's now ask how to turn these facts about current physics and

probability theory into an argument for the existence of God.

in the urn, so we can consider two different hypotheses about the origin

Much as we considered two different hypotheses about the number of balls

of the universe.

hypothesis that it was not.

created by an intelligent designer. Let the non-design hypothesis be the

Let the design hypothesis be the hypothesis that the universe

Let e be the fact that the cosmological constant has a

value in the life-permitting range.

Then what do we know about relevant probabilities?

$$Pr(e \mid \text{non-design}) = \frac{1}{10^{120}}$$

$$Pr(e|\text{design}) \equiv 0.5$$

Bayes' theorem

$$P(h|e) = \frac{P(h)*P(e|h)}{P(e)}$$

design hypothesis given evidence is that just plugging in the

numbers.

With this information in hand, figuring out the probability of the non-

$$Pr(\text{non-design}) = 0.5$$

$$Pr(\text{design}) = 0.5$$

$$Pr(e) = 0.25$$

$$Pr(\text{non-design} \mid e) = \frac{0.5 * \frac{1}{10^{120}}}{0.25} = \frac{2}{10^{120}}$$

It is difficult to think about numbers as large as the denominator of this fraction. But

PowerBar!

to give you some idea: the odds of winning Powerball are about 1 in 300 million. Now

consider the odds of winning Powerball one trillion times in a row. Call that a “super

that a 'super duper Powerball.'

Now consider the odds of winning a super Powerball one trillion times in a row. Call

Now consider the odds of winning a super Powerball one trillion times in a row.

The odds of this happening are about $1/10^{44}$ — so much, much higher than the

odd of the universe being life-permitting by chance.

This means that if you simply take the physics at face value, and begin by assigning a

probability of 0.5 to the non-design hypothesis, you should think that the chances of

superduperpowerball a trillion times in a row.

the non-design hypothesis being true are vastly lower than the chances of winning a

By contrast, the probability of the design hypothesis is very close to 1. It is, in fact, 1.

minus the very small number we're just discussing:

$$Pr(\text{design} \mid e) = 1 - \frac{2}{10^{120}}$$

This about as close to certainty as it is possible to get.
