

Today we turn to our third big question. This question can be introduced by an example.

Suppose that in the year 2069 the surviving members of this Introduction to Philosophy class decided to have an Intro to Philosophy reunion, and all gathered in this room. Suppose that they decided to get a group picture taken.

Now imagine that, via some sort of time travel device, I now have that photo, and show it to you. You might ask: Am I one of those people? Which one am I?

It is very natural to assume that these questions must have determinate answers. There must be some fact of the matter about whether one of the people in the photo is you. And, if one is you, there must be some fact of the matter about which one is you.

Let's suppose that this is true: there must be a fact about whether you survive to be
in this picture, and must be a fact about which of the survivors you are.

Then we can ask a question about these facts:

**The survival
question:** What does it
take for for some
person at some other
time to be you?

To introduce our main answers to the survival question, it will be useful to think about a simple, uncontroversial example of survival.

All of you believe that you will wake up tomorrow in your bed. To put the same point another way, all of you believe that the person now sitting in your seat is the same person as — identical to — the person who will wake up in your bed tomorrow morning.

What do we mean when we say that you are identical to that person?

Here it is important to get clear at the outset on one distinction which, if not attended to, can make these questions more confusing than they have to be.

This is the distinction between **numerical** and **qualitative** identity.

To say that x and y are numerically identical is to say that they are literally the same thing — they are one, not two.

To say that x and y things are qualitatively identical is to say that they are exactly resembling — they have just the same properties.

When we say that you are identical to the person who will get out of your bed tomorrow morning, we are not of course saying that you are qualitatively identical to that person. Their hair will be messed up, and they will be wearing different clothes.

Rather, we mean that you are numerically identical to that person: there is just

one person who is today in this class, and is tomorrow morning in that bed.

survival**

psycho-
logical
survival

But before considering combination views of this kind, let's start by getting clear on what our three simple views mean, and what might lead you to endorse one or another of them.

It is not hard to come up with arguments in favor of materialist
views.

First, they fit with much of our ordinary commonsense thought about ourselves. We think of ourselves as having height and weight and being located particular places; and these are properties of material things. We also think of ourselves as members of the species homo sapiens; and members of biological species seem to be material things.

Second, it arguably is the simpler overall theory of reality. We all believe in the existence of material things. The proponent of materialist survival doesn't have to believe in any extra things, like immaterial souls, over and above the material things we all already believe in.

example.

Let's suppose that this is true: there must be a fact about whether you survive to be

the 1990s, the number of people in the UK who are employed in the public sector has increased by 1.5 million, from 2.5 million in 1980 to 4 million in 1999 (Department of Health 2000). The number of people in the public sector who are employed in health care has increased by 1.2 million, from 1.3 million in 1980 to 2.5 million in 1999 (Department of Health 2000).

There is a growing emphasis on the need to improve the quality of health care, and this has led to a number of initiatives to improve the quality of health care. The Department of Health has set up a number of committees to monitor the quality of health care, and has introduced a number of measures to improve the quality of health care. The National Patient Safety Agency (NPSA) was set up in 2001 to monitor and improve the quality of health care. The NPSA has a number of functions, including monitoring the quality of health care, investigating incidents, and promoting good practice.

The NPSA has a number of initiatives to improve the quality of health care. One of the main initiatives is the National Patient Safety Programme (NPSP). The NPSP is a programme of work to improve the quality of health care, and it includes a number of initiatives, including the development of national standards, the promotion of good practice, and the investigation of incidents. The NPSP also includes a number of initiatives to improve the quality of health care, including the development of national standards, the promotion of good practice, and the investigation of incidents.
