

This is thus an example of a scenario which, at first glance, seems possible, but then turns out, on closer inspection to be impossible, because it contains a hidden contradiction. Might the someone who does not believe in immaterial souls plausibly say the same thing about the examples of zombies and spectrum inversion?

Maybe. But there are two residual challenges.

The first is just to say what this contradiction could be. It is easy enough to explain what the contradiction is in the story of the barber. But what is contradictory about the zombie or inversion of our AI robot scenarios?

The second is more subtle. And this is to explain why the scenarios seem conceivable in the first place. If phenomenal properties really are physical properties, why is it so easy to imagine cases in which there are phenomenal differences without physical differences? Why are phenomenal properties unlike, for example, density or shape or water or life in this way?
