

This is also suggested by the timing of the original experiment.

“Go-signal” tests suggest that the time between decision and an action like that performed by Libet’s subjects is between 200 and 250ms — not 550ms, as would be the case if RP-onset were a decision.

This also fits nicely with the alternative hypothesis that the decision does not take place at RP-onset time, but at W time.

Is RP-onset an
unconscious
decision?

If RP-onset is an
unconscious
decision, does
that limit our
free will?

replies to
Libet

A large, solid red circle is centered on a white background. Inside the circle, the text "the Libet experiments" is written in a white, sans-serif font, centered both horizontally and vertically.
