

But did subjects in the veto experiment ever decide to flex
their hands?

If subjects in the “veto” experiment never decided to flex their hands, and their brain activity was very similar to that observed at RP-onset, that strongly suggests that RP-onset is not a conscious decision.

This is also suggested by the timing of the original experiment.

Is RP-onset an
unconscious
decision?

If RP-onset is an
unconscious
decision, does
that limit our
free will?

In ancient times, philosophers worried about the challenge to free will from fate. After

the birth of modern physics, many worried about the challenges it would bring from

determinism. Our topic today is much more recent challenge to free

will prosper by contemporary neuroscience.
