

This is not unreasonable — we do often use simple acts, like deciding to scratch one's nose, as an example of a free action.

But Libet's subjects are in one central respect different than subjects of ordinary free actions: they are asked to be as spontaneous as possible, and avoid planning when they will flex their fingers.

That is not how most free actions work; in the case of most free actions, we consciously consider pros and cons of the action, and plan when to carry the action out.

This fact leads to a possibility that is worth considering.

If RP-onset is an
unconscious
decision, does
that limit our
free will?
