

It appears that the subject's brain is ready to flex the hand about 350ms **before**

the subject's experience of consciously deciding to flex his or her hand.

This makes it seem as though the conscious “decision” to flex one’s hand is not really a decision at all — that decision has already been made, unconsciously, by the brain.

And, Libet thought, an unconscious decision made in the brain, prior to any conscious act of deciding, cannot be free; free decisions must be consciously made.

replies to
Libet

A large, solid red circle is centered on a white background. Inside the circle, the text "the Libet experiments" is written in a white, sans-serif font, centered both horizontally and vertically.

the Libet
experiments

is free will
an important
good?

the subject's experience of consciously deciding to flex his or her hand.

It appears that the subject's brain is ready to flex the hand about 350ms before

This makes it seem as though the conscious 'decision' to flex one's hand is not

really a decision at all — that decision has already been made, unconsciously, by

the brain.

And, like thought, an unconscious decision made in the brain, prior to any

nade.

conscious act of deciding, cannot be free; free decisions must be consciously

the birth of modern physics, many worried about the challenges to free will from

determinism. Our topic today is much more recent challenge to free

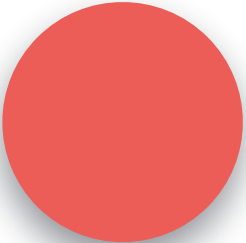

will prosper by contemporary neuroscience.

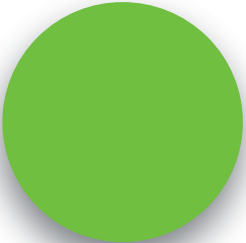

In ancient times, philosophers worried about the challenge to free will from fate. After

A large, solid red circle serves as the background for the text.

the Libet experiments

Does this show that there is **no** space for conscious free will? Libet thought not.
