

Let's now turn to our last line of objection to
Pascal.

A large orange circle with a thin grey border, containing white text.

It is
irrational to
form beliefs on
the basis of
expected utility
calculations.

Pascal's argument, as we have reconstructed it, relies on the following principle.

This principle seems plausible. But
so does this one:

Expected Utility $\rightarrow$ Belief

If believing P has a higher expected utility than not believing P, you should believe P.

Low Probability $\rightarrow$ No Belief

If you think that P has a very low probability of being true, you should not believe P.

Let's now turn to our last line of objection to

Passad!

Pascal's argument, as we have reconstructed

it, relies on the following principle.

so does this one:

This principle seems plausible. But

Expected Utility $\rightarrow$ Belief

If believing P has a higher expected utility than not believing P , you should believe P .

Low Probability $\rightarrow$ No Belief

If you think that P has a very low probability of being true, you should not believe P.

Expected Utility $\rightarrow$ Belief

If believing P has a higher expected utility than not believing P , you should believe P .

Low Probability $\rightarrow$ No Belief

If you think that P has a very low probability of being true, you should not believe P.
