

One might represent these assumptions as follows:

Courses
of
action

believe

don't
believe

God exists

God does not
exist

I

O

S

S

Probability = 0.5

Expected
utility

Let's suppose, plausibly, that if we believe in God, and God does not exist, this involves some loss of utility. This loss will be finite — let's symbolize it by the word “loss”.

Let's suppose, plausibly, that if we believe in God, and God does not exist, this involves some

loss of utility. This loss will be finite $\rightarrow$ let's symbolize it by the word 'loss'.
