**against
incompatibilist
free will**

This argument seems to show that the combination of four theses — that No one has any choice about the past, no choice about the laws of nature, the no choice principle, and determinism — rules out free will.

Since the first three of these theses seem quite plausible, the argument seems to show that if determinism is true, there are no free actions — and hence that free will is incompatible with determinism.

1. Free will is incompatible with determinism.
 2. If Libertarianism is true, then there is no free will.
-

C. There is no free will.

The master argument against the reality of free will

Real/|the master argument:

The consequence argument is a defense of premise (1). If you believe in free will, and find the consequence argument persuasive, it looks tempting to reply to the master argument by denying premise (2).

But, we'll see now, this argument can also be given a plausible defense.

One way to introduce this defense is with the following quote from

David Hume:

Hume's basic thought is that there is a big difference between free actions and actions which are random or chance.

Here's a thought experiment:

Now ask yourself: is Alex's choice free? It seems very clear that it is not. It is undetermined by facts prior to the relevant run of the Randomizer, but it is random. It is not up to Alex what he does; and free actions have to be up to the person doing the action.

This suggests:

But now consider the idea that free will requires the falsity of determinism. If this is true, then it must be that free actions (or their immediate causes) are undetermined:

But consider what an undetermined act would be. It would be an action which is such that the entire history of the universe up to that point is consistent with the act either happening or not happening. So if the act happens, nothing **makes** it happen. In particular, nothing that the person who does the action, or anyone else, does makes the action happen.

2. If an action is undetermined, then the agent does not control whether it happens.

1. If Libertarianism is true, then, if there are free actions, those actions are undetermined.
 2. If an action is undetermined, then it is random.
 3. If Libertarianism is true, then, if there are free actions, those actions are random. (1,2)
 4. No random acts are free.
-

C. If Libertarianism is true, then there are no free actions.

The control argument

One answer to this question relies on the idea of **agent causation**. In many cases, I cause something by participating in some event; for example, I cause my arm to go up by participating in the event of deciding to raise my arm.

But perhaps sometimes I just cause something 'directly,' rather than by doing something. Then one might say that the difference between free actions and the Randomizer example is that in the former the agent directly causes the action (or decision) in this way.

Does this make sense?
