

The first objection is based on certain interpretations of **quantum mechanics**, our best current theory of the physical world.

According to the standard interpretations of quantum mechanics – though not all interpretations of the theory – the physical world is indeterministic.

That is, what the laws of nature tell us in many cases is not what will happen, but rather just probabilities of various outcomes.

Imagine, for example, that we have some uranium, and we are interested in whether some particular atom will decay in a certain amount of time.

Suppose now that the atom does decay, and we ask: **why** did it decay?

Quantum mechanics will tell us something like this: there is a 12.37% chance that the atom will decay in that amount of time.

On standard interpretations of quantum mechanics, there is literally no answer to this question. There was a chance that it would, and a chance that it wouldn't, and it just did — end of story. Is that a problem for the PSR?

It appears so. For it looks like this would imply that there is a contingent fact -- namely, that the atom would decay at that moment -- which has no explanation.

The defender of the cosmological argument can always reply that this shows that quantum mechanics is incomplete. And this is not an entirely unreasonable thing to say. Quantum mechanics is inconsistent with our other best theory of the physical world -- the general theory of relativity -- which suggests that the correct complete theory of the physical world may not look quite like any of our current theories.

complete theory of the physical world may not look quite like any of

... we cannot find in any of the individual things, or even in the entire collection and series of things, a sufficient reason for why they exist.

Let us suppose that a book on the elements of geometry has always existed, one copy always made from another. It is obvious that although we can explain a present copy of the book from the previous book from which it was copied, this will never lead us to a complete explanation, no matter how many books back we go, since we can always wonder why there have been such books.

What is true of these books is also true of the different states of the world ... however far back we might go into previous states, we will never find in those states a complete explanation for why there is a world at all, and why it is the way it is.
